New peptide antagonist of zonulin useful as antiinflammatory agent for

```
This present sequence is that of a peptide antagonist of zonulin CC (2), one of 25 such peptides (see Y79105-29) of the invention, which bind to a zonula occludent toxin (ZOT) receptor, yet do not CC (TJ). The peptide antagonists are based on a common motif of ZOT cand human zonulins, which is believed to be critical for receptor cc and human zonulins, which is believed to be critical for receptor cc inflammation, where they bind to the ZOT receptor in the intestine cf inflammation, where they bind to the ZOT receptor in the intestine cc intestine. Gastrointestinal inflammation conditions give rise to creased intestinal permeability and the peptide is useful for caused by infection, e.g. Clostridium difficie infection, concentrations that cause protein losing enteropathy cc intestinal conditions that cause protein losing enteropathy cc infestation, bacterial overgrowth, whipple s disease, with cc collagenous colitis, inflammatory bowel disease, diseases with cc correction of congenital heart disease with Fontan's operation, collisases without ulceration, e.g. Menetries' disease, costaophilic gastroenteritis, and immune disease, cc. systemic lupus ervthematorys or fond allowance disease, cc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Matches

This present sequence is that of a peptide antagonist of zonulin CC (Z), one of 25 such peptides (see Y79105-29) of the invention, CC which bind to a zonula occludens toxin (ZOT) receptor, yet do not CC physiologically modulate the opening of mammalian tight junctions (ZT). The peptide antagonists are based on a common motif of ZOT CC and human zonulins, which is believed to be critical for receptor CC and human zonulins, which is believed to be critical for receptor CC antifolian tDNA techniques. The peptide antagonists are used as an inflammatory agents in the treatment of gastrointestinal CC and yet does not physiologically modulate the opening of Ty in the CC increased intestinal permeability and the peptide is useful for CC treating intestinal conditions that cause protein losing enteropathy caused by infection, e.g. Clostridium difficile infection, enterocolitis, shigellosis, viral gastroenteritis, parasite mucosal erosion or ulcerations, e.g. gastritis, gastric cancer, CC infestation bacterial overgrowth, whipple's disease, diseases with collegenous colitis, inflammatory bowel disease, diseases with collegenous colitis, inflammatory bowel disease, diseases marked by sarcoidosis lymphoma, mesenteric tuberculosis, and after surgical correction of congenital heart disease with Fontan's operation, ceg. solitis, and disease with solitis and disease, eosinophilic gastroenteritis, and immune diseases, ceg. gastroenteries disease, eosinophilic gastroenteritis, and immune diseases, ceg. gastroenteries, disease, comparation, e.g. wenettrier's disease, comparation, e.g. solitis, and immune diseases, ceg. gastroenteritis, and immune diseases.
                                                                                                                                                                                                                                                                   Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New peptide antagonist of zonulin useful as antiinflammatory agent treating cerebral ischemia, stroke, cerebral edema, gastritis, shigellosis, viral gastroenteritis, meningitis, encephalomyelitis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Claim 1; Page 48; 69pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Fasano

The present invention describes fusion proteins comprising a chemokine and a tumour antigen or HIV antigen. Specifically claimed fusion proteins comprise: (1) human monocyte chemotactic protein-3 (MCP-3) and human Muc-1; (2) human interferon induced protein 10 (IP-10) and human Muc-1; (3) human macrophage-derived chemokine (MCD) and human Muc-1; (4) human SDF-1 and human MCP-3 and HIV gpl20; (7) human MCD and HIV gpl20; and (8) human SDF-1 and HIV gpl20. The fusion proteins, and nucleotide sequences encoding them, can be used for producing an immune response, e.g. an effector T cell immune response. They can also be used for treating cancer or treating or preventing HIV infection. The fusion proteins and/or nucleotide sequences can be used in in vitro diagnostic assays, as well as in screening assays for identifying unknown tumour antigen epitopes and fine mapping of tumour antigen epitopes. The present sequence represents a specifically claimed fusion protein from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match

The present invention describes fusion proteins comprising a chemokine CC and a tumour antigen or HIV antigen. Specifically claimed fusion proteins CC comprise: (1) human monocyte chemotactic protein-3 (MCP-3) and human CC (Muc-1; (2) human interferon-induced protein 10 (IP-10) and human Muc-1; (2) human Muc-1; (5) human IP-10 and HIV 9p120; (6) human MCP-3 and CC HIV 9p120; (7) human MCP and HIV 9p120; and (8) human MCP-3 and CC (9p120). The fusion proteins, and nucleotide sequences encoding them, can CC be used for producing an immune response, e.g. an effector T cell immune CC preventing HIV infection. The fusion proteins and/or nucleotide sequences compared to the used in in vitro diagnostic assays, as well as in screening assays. CC can be used in in vitro diagnostic assays, as well as in screening assays. CC tumour antigen epitopes and fine mapping of continuour antigen epitopes. The present sequence represents a specifically
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               RESULT

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to coding sequences (see F44740-F44840 and F44843-F44844) and proteins (see B65714-B65814) involved in programmed cell death (PCD; apoptosis). The coding sequences and proteins of the present invention are useful for modulating a PCD or cell death pathway and various developmental pathways in a forestry plant, by stably incorporating one of the present coding sequences into the genome of the forestry plant, where the coding sequences into the genome of the not present in a native form of the forestry plant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Chemokine; tumour; viral; antige
immune response; HIV; infection.

CC The present invention describes fusion proteins comprising a chemokine CC and a tumour antigen or HIV antigen. Specifically claimed fusion proteins CC wuc-1; (2) human monocyte chemotactic protein-3 (MCP-3) and human CC Muc-1; (2) human monocyte chemotactic protein-10 (IP-10) and human Muc-1; (3) human fusion protein 10 (IP-10) and human Muc-1; (4) human CC SDF-1 and human Muc-1; (5) human IP-10 and HIV 9p120; (6) human MCP-3 and CC HIV 9p120; (7) human MDC and HIV 9p120; and (B) human SDF-1 and HIV CC SDF-1 and human MCP-3 and SDF-1 and HIV SDF-1 and H
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  В
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     οy

                               The invention relates to a method for the production of non-immunogenic proteins. The method comprises determining at least part of the amino acid sequence of the protein; (b) identifying in the amino acid sequence one or more potential epitopes for T-cells (T-cell epitopes) of the given species; and (c) modifying the amino acid sequence to eliminate at least one of the T-cell epitopes identified in step (b) thereby to eliminate or reduce the immunogenicity of the protein when exposed to the immune system of the given species. A method of analysing a pre-existing protein to predict the basis for immunogenic responses is also provided. The methods can be used particularly for reducing the immunogenicity of immunogeniting the immunogenities. From humanised A33 heavy chain variable region predicted by
                                                                                                                                                                                                                                   Reducing immunogenicity sequence of the protein of a given species
                                                                                                                                                                                                             Example 5;

                                                                                                                                                                                                                  The invention relates to a method for the production of non-immunogenic proteins. The method comprises determining at least part of the amino acid sequence of the protein; (b) identifying in the amino acid sequence one or more potential epitopes for T-cells (T-cell epitopes) of the given one of the T-cell epitopes identified in step (b) thereby to eliminate at least reduce the immunogenicity of the protein when exposed to the immune system of the given species. A method of analysing a pre-existing protein methods can be used particularly for reducing the immunogenicity of immunogenic responses is also provided. The immunoglobulins or therapeutic proteins, e.g. Streptokinase. The products can be used for diagnosis and therapy. Sequences W86075-W86114 represent peptides from humanised A33 heavy chain variable region predicted by
                                                                                                                                                                                           Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                          Reducing immunogenicity of proteins - by modifying the amino acid sequence of the protein to eliminate potential epitopes for T-cells
                                                                                                                                                                                                                                                                                                                                                                                                         Example 5; Page 33; 77pp; English

                                                                                                                                                                                                                                                                                                                The invention relates to a method for the production of non-immunogenic proteins. The method comprises determining at least part of the amino acid sequence of the protein; (b) identifying in the amino acid sequence one or more potential epitopes for T-cells (T-cell epitopes) of the given one of the T-cell epitopes identified in step (b) thereby to eliminate or reduce the immunogenicity of the protein when exposed to the immune to predict the basis for immunogenic responses is also provided. The immunoglobulins or therapeutic proteins, e.g. Streptokinase. The products can be used particularly for reducing the immunogenicity of can be used for diagnosis and therapy. Sequences w86075-w86114 represent peptides from humanised A33 heavy chain variable region predicted by
                          IgG heavy chain fragment, IgG (VH) (18).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This sequence represents a fragment of the IgG heavy chain. This sequence was isolated using the biomedical device of the invention, which comprises: (a) a biocompatible support; and (b) conglutinin which is covalently bound to the support. The device can be used for removing immune complexes (IC) from a fluid. This can be used for treating a mammal or for evaluating the status of a mammal. It can be used for treating diseases such as serum sickness, chronic immune complex nephritis, bacterial infections, viral infections, parasitic diseases, autoimmune diseases or neoplastic diseases. The devices can also be used for purification of IC and to study immune pathogenesis and antigens associated with a disease state. The covalently immobilised conglutinin can capture IC with high capacity and specificity and allows elution under mild conditions. The devices are stable with no loss of IC binding
                                                                                                                                                                                                                                                                              Antibody; human; influenza type A virus; H1N1; H2N2; H3N2; HA; diagnosis; haemagglutinin; variable light chain; therapy; CDR;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           RESULT 14
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  R82833 and R82834 represent the N-terminal sequences of the heavy chain CC and light chain of an anti-human influenza A type virus antibody. The antibody these sequences were obtained from was isolated from hybridoma CC C179. The antibody recognises the stem region of the haemagylutinin (HA) CC molecule of the H1N1 and H2N2 subtypes of human influenza A type virus, CC and shows neutralisation activity against these two subtypes. The CC antibody shows no recognition of the H3N2 subtype. The DNA encoding the CC variable heavy chain sequence (see T04159) and the variable light chain CC coding sequence (see T04150) are useful in the production of artificial CC coding sequence (see T04150) are useful in the production of artificial CC coding sequence (see T04150) are useful in the diagnosis and treatment of human CC influenza. As the antibodies are useful in the diagnosis and treatment of human CC influenza. As the antibodies recognise the stem region of the HA molecule CC changes. This provides an advantage over current vaccines, as the virus company of the that the contraction of the HA molecule contraction of the HA molecule.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Query Match

New purified zonulin - which is mammalian tight junctions, used

capable of reversibly opening for enhancing the delivery of agents

across intestinal and nasal mucosa and blood brain barrier

Page 45; 64pp; English

```
cc opening mammalian tight junctions. Zonulin proteins function as
CC physiological modulators of mammalian tight junctions. They can be used
CC for enhancing the absorption of therapeutic agents across tight
CC the blood brain barrier. Zonulin can be used with agents such as drugs,
CC e.g. lidocaine, adenosine, dobutamine; dopamine, epinephrine,
CC uprenorphine, naloxone, ketorolac, midazolam, propofol, metacurine,
CC mivacurium, succinylcholine, cytarabine, mitomycin doxorubicin,
CC vinoristine, vinblastine, methicillin, mezlocillin, piperacillin,
CC cetoxitin, cefenicid, cefmetazole and aztreonam, a hormone e.g.
CC vinoristine, vinblastine, menotropins, insulin, urofolitropin,
CC cetoxitin, cefenicid, cefmetazole and aztreonam, a hormone e.g.
CC interferon-alpha, interferon-beta, interferon-gamma, interleukin-1
CC the proteins can also be used for the production of antibodies which can be used to assay for zonulin in body tissue or fluids, or in affinity-
cu purification of zonulin. The present sequence represents an N-terminal xx
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match

                                                                                                                                           The present sequence is that of the N-terminal region of adult human heart zonulin. The N-terminal sequences of human adult and foetal zonulins (see Y79130-36) were compared with Vibrio cholerae zonula occludens toxin (207) to identify a common motif thought to be involved in receptor binding. Peptide antagonists (see Y79105-29) based on this motif are useful as antiinflammatory agents for treatment of gastrointestinal inflammation, and for treatment of conditions associated with breakdown of the blood-brain

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Score

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              CC molecular weight of 47 kD, as determined by EDS-PAGE, which is co-coludens toxin (207) polyclonal antibody and is capable of reversibly co-coludens toxin (207) polyclonal antibody, and is capable of reversibly co-coludens toxin (207) polyclonal antibody, and is capable of reversibly co-coloring mammalian tight junctions. Zonulin proteins function as co-coloring mammalian tight junctions. They can be used for enhancing the absorption of therapeutic agents across tight co-coloring intestinal and nasal mucosa and across tight junctions of intestinal and nasal mucosa and across tight junctions of co-coloring intestinal and nasal mucosa and across tight junctions of co-coloring intestinal and nasal mucosa and across tight junctions of co-coloring intestinal and property coloring intestinal inte
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Matches
                                         New peptide antagonist of zonulin useful as antiinflammatory agent treating cerebral ischemia, stroke, cerebral edema, gastritis, shigellosis, viral gastroenteritis, meningitis, encephalomyelitis
                 Example
                                                                                                                                      WPI; 2000-205565/18

                        Framework regions (R87049-52) of human group III (gp3) germ line antibody heavy chain showed homology to corresponding regions (R87053-56, respectively) of the rat anti-human interleukin-5 monoclonal antibody 39D10 heavy chain (see R87039). This homology was utilised in the prodn. of a humanised 39D10 VH (R87058) in which rat 39D10 VH complementarity determining regions were grafted

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence is that of the N-terminal region of adult human heart zonulin. The N-terminal sequences of human adult and foetal zonulins (see Y9130-36) were compared with Vibrio cholerae zonula occludens toxin (ZOT) to identify a common motif thought to be involved in receptor binding. Peptide antagonists (see Y79105-29) based on this motif are useful as antiinflammatory agents for treatment of gastrointestinal inflammation, and for treatment of conditions associated with breakdown of the blood-brain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       25-JUN-1996

CC This invention relates to a new human antibody specific for human CC interlewkin-12 (IL-12). The invention also includes antigen binding CC portions that bind to IL-12. Sequences B39485-B39516 represent human CC anti-IL-12 antibody heavy and light chain complementarity determining CC region (CDR) amino acid sequences. Other variable region amino acid sequences are CC given in B39517-B39560 and B40068-B40149. Sequences B39561-B39771 CC represent anti-IL-12 CDR3 related amino acid sequences B39772-B40063 CC represent other CDR sequences. Light chain CDR3 consensus sequences are CC given in B40064-B40067. Primers used in the identification and CC construction of the antibodies of the invention are given in CC C61062-C61071. The antibody of the invention is a neutralising antibody CC and has antirheumatic; antiarthritic; antiasterotic; antiantiantarastic; neuroprotective; antipsoriatic; antiasthmatic; cardiant; antiparastic; antibacterial and immunosuppressive activity. The antibodies or antibacterial and immunosuppressive activity. The antibodies or antiparability and the derivation of the antiparability antisorders associated with detrimental release of human IL-12, especially Crohn's classes, multiple sclerosis and rheumatoid arthritis. They can also be caused in the invention of the antiparastic antiparastic of the property of the constitution of the constituti
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          antisclerotto; determining region; CDR; antirheumatic; antiarthritic; antiparastto; antibacterial; amunosuppressive; Crohn's disease; multiple sclerosis; rheumatoid arthritis.

Modification of a rodent antibody (Ab) or fragment by resurfacing in order to produce a humanised rodent Ab can be determined by calculating homology between murine and human Ab antibody surfaces. In order to test were set up: (1) traditional loop graffing; (2) resurfacing approach sequences with most similar chain; and (3) resurfacing approach using human anti-N901 Ab (see R52061). Experiment 3 was carried out using the present with 74 percent homology with anti-N901 Ab (see R52061). Experiment 3 was carried out using the present with 74 percent homology with anti-N901 Ab (see R52067) was preped. by resurfacing. Sequence numbering starts at position 118 in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            0;

                                                              밁
                                                                             Ş
                                                                                                                                               SXU
                                                                                                                                                            This is the heavy chain amino acid sequence of germline (GL) pp58 antibody. The invention relates to the construction and use of human MADs specific for the fusion (F) protein of respiratory syncytial virus (RSV) to passively treat, prevent or detect RSV infection. Hul9A, Hul9B, Hul9C and Hul9D MADs are claimed. These are reshaped human antibodies comprising a heavy chain selected from 19A, 19B, 19C or 19D (see W59615-18), which are based on the GL Dp58 sequence, and a light chain selected from 19A, 19B, 19C or 19D (see W59620-21). Such engineered antibodies are neutralising; they inhibit virus growth in viro and in vivo in animal models of RSV infection. Nucleic acids viro and the human MADs, recombianant plasmids (see V41427-33) and host cells (e.g. COS, CHO, myeloma) or are provided.

CC This invention relates to a new human antibody specific for human CC interleukin-12 (IL-12). The invention also includes antigen binding CC portions that bind to IL-12. Sequences B39485-B39516 represent human CC anti-IL-12 antibody heavy and light chain complementarity determining CC amino acid sequences. Other variable region amino acid sequences are CC given in B39517-B39560 and B40068-B40149. Sequences B39561-B39771 CC represent anti-IL-12 CDR3 related amino acid sequences B39772-B40063 CC represent other CDR sequences. Light chain CDR3 consensus sequences are CC given in B40064-B40067. Primers used in the identification and CC construction of the antibodies of the invention are given in CC C61062-C61071. The antibody of the invention is a neutralising antibody CC and has antirheumatic; antiarthritic; antisclerotic; antiparasitic; cantibacterial and immunosuppressive activity. The antibodies or CC antibacterial and immunosuppressive activity. The antibodies or CC antiparation fragments are useful in the treatment of disorders CC associated with detrimental release of human IL-12, especially Crohn's CC disease, multiple sclerosis and rheumatoid arthritis. They can also be CC used in the manufacture of a pharmaceutical composition to treat human CC IL-12 disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; neutralising antibody; interleukin-12; IL-12; antiinflammatory; complementarity determining region; CDR; antirheumatic; antiarthritic; antisclerotic; neuroprotective; antipsoriatic; antiasthmatic; cardiant; antiparasitic; antibacterial; immunosuppressive; Crohn's disease:

```
cc region (CDR) amino acid sequences, and also includes variable region camino acid sequences. Other variable region amino acid sequences are given in B39517-B39560 and B40068-B40149. Sequences B39561-B39771 CC represent anti-II-12 CDR3 related amino acid sequences, B3972-B40063 CC represent other CDR sequences. Light chain CDR3 consensus sequences are CC given in B40064-B40067. Primers used in the identification and CC construction of the antibodies of the invention are given in CC construction of the antibodies of the invention are given in CC c61062-C61071. The antibody of the invention is a neutralising antibody CC and has antirheumatic; antiarthritic; antiasthmatic; cardiant; antiparasitic; CC entroprotective; antipsoriatic; antiasthmatic; cardiant; antiparasitic; CC antibacterial and immunosuppressive activity. The antibodies or CC antipsoriatic with detrimental release of human II-12, especially Crohn's CC disease, multiple sclerosis and rheumatoid arthritis. They can also be used in the manufacture of a pharmaceutical composition to treat human or II-12 also be a constructed with detrimental composition to treat human in the construction is a construction of a pharmaceutical composition to treat human in the construction is a construction of the construction of a pharmaceutical composition to treat human in the construction is a construction of the construction of a pharmaceutical composition to treat human in the construction is a construction of the co

This invention relates to a new human antibody specific for human control interleukin-12 (IL-12). The invention also includes antigen binding portions that bind to IL-12. Sequences B39485-B39516 represent human can antibody heavy and light chain complementarity determining cantin-IL-12 antibody heavy and light chain complementarity determining cannon acid sequences. Other variable region amino acid sequences are constituted in B39717-B3950 and B40068-B40149. Sequences B39517-B3950 and B40068-B40149. Sequences B39512-B39717-B40063 crepresent anti-IL-12 CDR3 related amino acid sequences B39572-B40063 crepresent other CDR sequences. Light chain CDR3 consensus sequences are construction of the antibodies of the invention are given in B40064-B40067. Primers used in the identification and construction of the antibody of the invention is a neutralising antibody cand has antirheumatic; antiarthritic; antiscierotic; antiinflammatory; candians antipacasitic; antiarthritic; antiscierotic; antiinflammatory; cantibacterial and immunosuppressive activity. The antibodies or constructorial and immunosuppressive activity. The antibodies or cantibacterial and immunosuppressive activity. Especially Crohn's cascaisted with detrimental release of human IL-12, especially Crohn's cused in the manufacture of a pharmaceutical composition to treat human custorials.

                                                                                                                                                                           CC This invention relates to a new human antibody specific for human CC interleukin-12 (IL-12). The invention also includes antigen binding CC portions that bind to IL-12. Sequences B39485-B39516 represent human CC anti-IL-12 antibody heavy and light chain complementarity determining CC region (CDR) amino acid sequences, and also includes variable region CC amino acid sequences. Other variable region amino acid sequences are CC given in B39517-B39500 and B40068-B40149. Sequences B39512-B39771 CC represent anti-IL-12 CDR3 related amino acid sequences B39772-B40063 CC represent other CDR sequences. Light chain CDR3 consensus sequences are CC given in B40064-B40067. Primers used in the identification and CC construction of the antibodies of the invention are given in CC C61062-C61071. The antibody of the invention is a neutralising antibody CC and has antirheumatic; antiarthritic; antisclerotic; antiparasitic; CC antibacterial and immunosuppressive activity. The antibodies or CC antigen-binding fragments are useful in the treatment of disorders CC antigen-binding fragments are useful in the treatment of disorders CC disease, multiple sclerosis and rheumatoid arthritis. They can also be CC used in the manufacture of a pharmaceutical composition to treat human CC II.-12 disorders

.ID B
CC This invention relates to a new human antibody specific for human control interleukin-12 (IL-12). The invention also includes antigen binding comportions that bind to IL-12. Sequences B39485-B39516 represent human compositions that bind to IL-12. Sequences B39485-B39516 represent human composition (CDR) amino acid sequences, and also includes variable region composition acid sequences. Other variable region amino acid sequences are composition and sequences. Other variable region amino acid sequences are composition in B39517-B39560 and B40088-B40149. Sequences B39517-B39719 cc represent anti-IL-12 CDR3 related amino acid sequences, B39772-B40063 crepresent other CDR sequences. Light chain CDR3 consensus sequences are composition of the antibodies of the invention are given in B40064-B40067. Primers used in the identification and construction of the antibodies of the invention are given in CC C61062-C61071. The antibody of the invention is a neutralising antibody can has antirheumatic; antiarthritic; antisclerotic; antiparasitic; cantibacterial and immunosuppressive activity. The antibodies or constitute of intervention are given in continuous constated with detrimental release of human IL-12, especially Crohn's disease, multiple sclerosis and rheumatoid arthritis. They can also be cused in the manufacture of a pharmaceutical composition to treat human cr. IL-12, discreters
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    (BADI )

This invention relates to a new human antibody specific for human continuous that bind to II-12. Sequences B39485-B39516 represent human continuous that bind to II-12. Sequences B39485-B39516 represent human continuous that bind to II-12. Sequences B39485-B39516 represent human continuous that bind to II-12. Sequences B39485-B39516 represent human continuous variable region continuous variable region continuous variable region amino acid sequences are given in B39517-B39560 and B40068-B40149. Sequences B39561-B39771 continuous variable region amino acid sequences are represent anti-II-12 CDR3 related amino acid sequences, B39772-B40063 continuous variable region and continuous variables of the invention are given in continuous variables of the invention is a neutralising antibody continuous variables of antibacterial and immunosuppressive activity. The antibodies of the associated with detrimental release of human II-12, especially Crohn's continuous variable region in the treatment of disorders associated with detrimental release of human II-12, especially Crohn's continuous variables and rheumantoid arthritis. They can also be read in the mannifacture of a charmacontical composition to treat human incomplements are useful in the treatment of treat human incomplements and rheumantoid arthritis. They can also be region to the mannifacture of a charmacontical composition to treat human incomplements are useful composition to treat human incomplements and rheumantoid arthritis.

                                                                                                                                     interleukin-12 (IL-12). The invention also includes antigen binding portions that bind to IL-12. Sequences B39485-B39516 represent human anti-IL-12 antibody heavy and light chain complementarity determining region (CDR) amino acid sequences, and also includes variable region amino acid sequences. Other variable region amino acid sequences are given in B39517-B39560 and B40068-B40149. Sequences B39561-B39771 represent anti-IL-12 CDR3 related amino acid sequences, B39772-B40063 represent other CDR sequences. Light chain CDR3 consensus sequences are given in B40064-B40067. Primers used in the identification and construction of the antibodies of the invention are given in C61062-C61071. The antibodies of the invention are given in construction of the antibody of the invention are given in construction antiportatic; antiarthritic; antisclerotic; antiinflammatory; neuroprotective; antiposcriatic; antiasthmatic; cardiant; antiparasitic; antiparasitic;
                                             antibacterial and immunosuppressive activity. The antibodies or antigen-binding fragments are useful in the treatment of disorders associated with detrimental release of human IL-12, especially Crohn's disease, multiple sclerosis and rheumatoid arthritis. They can also be used in the manufacture of a pharmaceutical composition to treat human
                                                                                                                                                                                                                                                                                                                                                                              This invention interleukin-12
                                                                                                                                                                                                                                                                                                                                                                                                                                  Claim 75; Page 121; 377pp; English.
